RESIDENTIAL

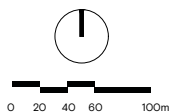

Project Overview

The redesign of this 1990s apartment in Agia Paraskevi addresses the needs of a growing four-member family through a spatially efficient and materially cohesive intervention. Originally composed of two bedrooms and a disproportionate open-plan living area, the project introduces a third bedroom and redefines the daytime zone by inserting “nests” of differentiated use—bar, desk, media corner, wardrobe—within a unified material palette. A linear kitchen island with integrated cooktop becomes the spatial and social anchor of the home. Custom lighting delineates zones while preserving openness. Construction budget remained within standard renovation costs.

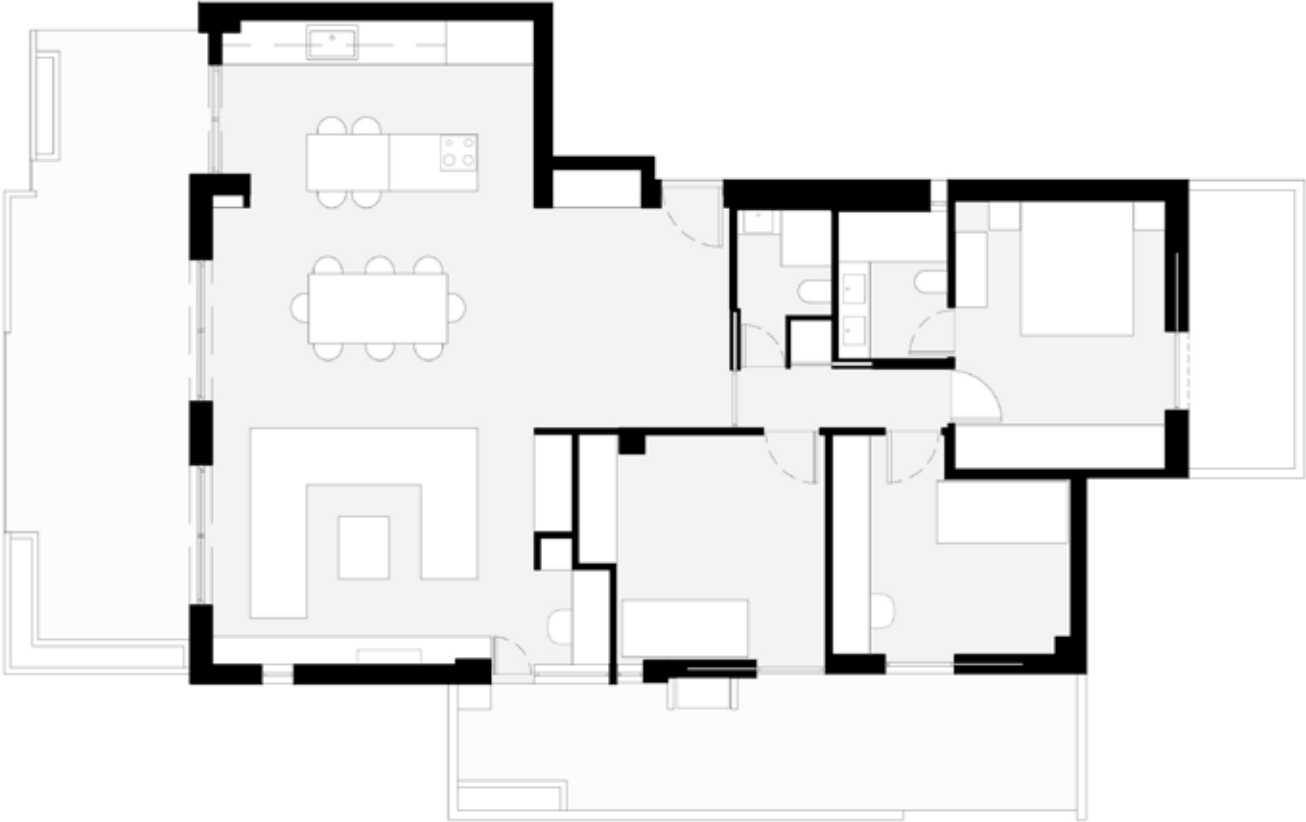

Project History

The project emerged from the clients’ urgent need to adapt their home to accommodate their growing children without relocating. Initially a two-bedroom flat with excess unused space in the living area, the apartment felt both too open and too limiting. The architectural intervention was conceived to work within the constraints of the existing footprint while reprogramming the layout to provide a third bedroom, introduce spatial clarity, and better reflect the family’s daily rhythms. Through thoughtful design gestures—spatial “nests,” a multifunctional kitchen island, and visually connected zones—the project succeeded in transforming the apartment into a cohesive, livable, and future-oriented space. The clients report a dramatic improvement in how the home supports both individual needs and collective family life, while the project serves as a model for other families in similar aging urban buildings seeking smart, low-cost transformations.
