The masses containing the programs that will form the structure are shaped in line with the volumes required by the programmes and harmonize with the existing tree layout and topography.

Building masses serving various functions are built with the help of decks that ensure circulation continuity. It ensures inter-functional integrity by establishing relationships with each other.

Canopies built on masses that gain volume, not only provide solar control, but also strengthen the perception of integrity by giving dynamism to the building.

The architectural composition shaped around the mass-canopy relationship takes its final form without conflicting with the surrounding context.
