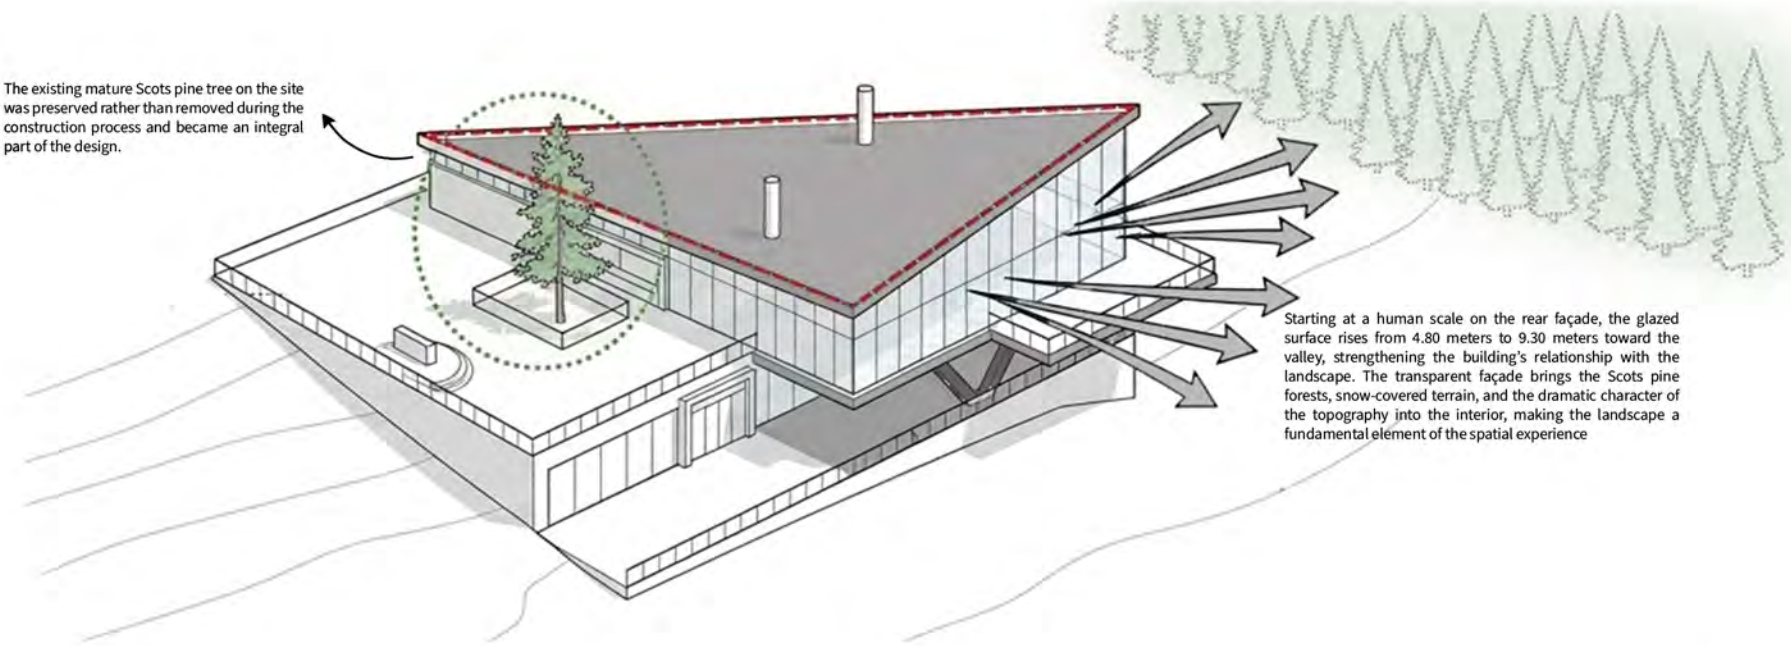
The existing mature Scots pine tree on the site was preserved rather than removed during the construction process and became an integral part of the design.

Starting at a human scale on the rear façade, the glazed surface rises from 4.80 meters to 9.30 meters toward the valley, strengthening the building's relationship with the landscape. The transparent façade brings the Scots pine forests, snow-covered terrain, and the dramatic character of the topography into the interior, making the landscape a fundamental element of the spatial experience



The roof form rising toward the landscape directs the user experience towards the surrounding scenery, allowing the building to establish a stronger sense of integration with the Scots pine forests and the mountain silhouette.

An architectural approach that integrates with the topography rather than opposing it

The semi-open space created beneath the cantilever offers visitors a direct relationship with the landscape while providing a sheltered area protected from heavy snowfall and harsh weather conditions
