

REHABILITATION OF THE ROMANO-CATHOLIC PARISH HOUSE

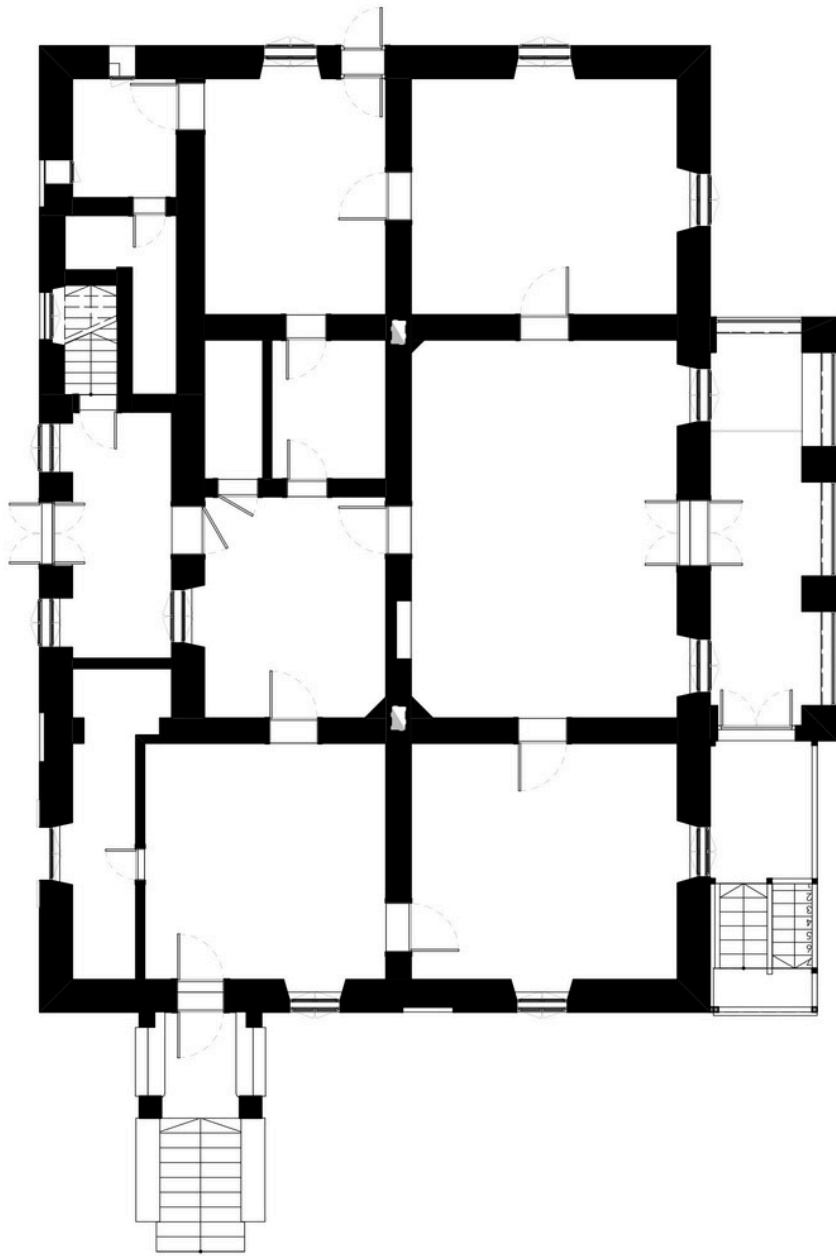

We present an example where
a building with environmental value was not considered, within the
framework of a possible upcycling, with the addition of new
valuable parts.

The Roman Catholic parish building was built in 1867, in Gyergyószárhegy.

1:1000

Instead, by eliminating the extensions and subsequent interventions, the original situation of the building was restored, which would make it possible for it to be listed as a historic building.

The parasitic staircase was removed, the loggia was reopened by removing the carpentry, the original access through the loggia was restored, the window from the back area was reopened.

The loggia was closed with a row of windows.

The building was returned to its original form,
with almost complete preservation of the historical substance.

The original
carpentry
and their fittings
have been
restored,
replaced with
replicas of the
original historic
windows.

The steps of the stairs were
made of stone steps
recovered from old,
demolished houses in the
area.

As a final conclusion:

we hope that through the intervention, the list of historic buildings will be enriched with a new position.
